Background

NCE was selected by the City of Manhattan Beach to perform an update of its Pavement Management Program (PMP). The City's last update was in 2015 using the StreetSaver[®] software. The goal of this project is to update the PMP with current pavement conditions and to perform funding analyses in order to help inform and educate policy makers.

Broadly, a "... pavement management system is designed to provide objective information and useful data for analysis so that ... managers can make more consistent, cost-effective, and defensible decisions related to the preservation of a pavement network."¹ In other words, a PMP is designed to assist cities with answering questions such as:

- What does the City's street network consist of and what are the street conditions?
- How will the condition of the City's maintained streets respond over time under the existing funding level?
- What maintenance and rehabilitation (M&R) strategies exist to improve the current street conditions?
- What is the backlog of M&R work that should be done in order to achieve the City's pavement condition goal?
- What are the future M&R needs?
- What are the street repair priorities?
- How much funding is needed in order to maintain or improve the current street conditions?

In order to answer the questions above, the City uses the StreetSaver[®] software platform to maintain its PMP. StreetSaver[®] is a program developed by the Metropolitan Transportation Commission (MTC) and is the most widely used PMP in California. The StreetSaver[®] program utilizes the pavement condition index (PCI) which was developed by the U.S. Army Corps of Engineers, which is a widely used standard in the United States and internationally.

For the 2018 update, the City's entire vehicular street network was inspected via a walking inspection method as outlined in ASTM D6433-16². The walking inspection method generally produces a more accurate representation of the pavement condition when compared to the semi-automated inspection method that the City adopted for in the 2015 update. The most recent inspection was completed in of May 2018 (pedestrian-streets are not part of this update).

² ASTM. "ASTM D6433-16." Standard Practice for Roads and Parking Lots Pavement Condition Index Inspections.

Study Objectives

The objectives of this study were to:

- Implement a PMP to assist the City with inventorying its street sections and assist policy makers in making decisions regarding street maintenance.
- Perform pavement condition inspections of the entire street network and determine the overall PCI.
- Develop appropriate M&R strategies.
- Perform budgetary analysis and determine the M&R funding needs.

Finally, this report links the recommended repair program costs to the City's current and projected budget alternatives to improve the overall network condition. It also assesses the adequacy of existing revenues to meet the recommended maintenance needs, and maximizes the return from expenditures by:

- Implementing a multi-year street M&R program;
- Developing a preventive maintenance program; and
- Selecting streets for the most cost effective repairs.

Scope of Work

The scope of work included performing pavement condition inspections on the entire street network as per the protocols described in ASTM D6433-16². The inspections were completed in May of 2018 using a walking inspection method.

Note that the condition inspections did not address non-pavement issues such as traffic, safety and street hazards, geometric issues, drainage issues, or immediate maintenance needs. As part of this task, a Quality Control Plan was developed and implemented. A copy is included in Appendix L.

Upon completion of the data collection activities, NCE reviewed M&R strategies with the City staff. This included the selection of appropriate treatments such as surface seals or overlays, and the determination of unit costs. The unit costs are based on recent bid tabs from the City and surrounding agencies and include the related construction costs and engineering and design costs. Once appropriate M&R alternatives were defined, they were entered into the StreetSaver[®] decision tree for budgetary analyses.

NCE next performed a budget needs analysis using an analysis period of seven years with an annual inflation rate of 3 percent. This identified M&R requirements for each street section and determined the total M&R requirements over the analysis period under different funding levels. The purpose of a seven-year plan is to prepare the rotating maintenance list and plan for any unusual increases in funding needs that might arise in future years. The seven-year plan also provides an extended view and assist the City in its five-year Capital Improvement Plan (CIP) preparation.

Pavement Network and Current Condition

The City of Manhattan Beach is responsible for the repair and maintenance of approximately 100.1 centerline miles of streets of which 8.0 miles are arterials, 7.6 miles are collectors, and 84.5 miles are residential. GIS maps showing the street functional classes based on both the City's General Plan Circulation Element as well as the Federal Highway Administration (FHWA) definition are shown in Appendix K. Street pavements are one of the City's most valuable assets, and the replacement value is estimated to be approximately \$87.1 million, which was calculated by combining each street section's projected reconstruction cost (refer to Appendix G for the reconstruction cost for each functional classification and surface type.) Note that this does not include the value of other non-pavement street components, such as curb and gutters, sidewalks, drainage etc.

The PCI is a measurement of pavement grade or condition and ranges from 0 to 100. The pavement condition is primarily affected by the climate, traffic loads and volumes, construction materials and age. For example, a newly constructed street will have a PCI of 100, while a street that is near the end of its service life will have a PCI of 25 or less. The service life of a street also depends primarily on traffic loads and volumes. For instance, an arterial such as Rosecrans Avenue that may see an abundance of heavy-truck traffic could have a service life of 15 to 20 years while a residential street such as John Street, with a trash truck service once or twice a week, may have a longer service life (25 to 30 years). Some of the distresses manifested by a pavement as it ages are:

Asphalt Concrete (AC) Pavement:

- Alligator (Fatigue) Cracking*
- Bleeding
- Block Cracking
- Bumps and Sags
- Corrugation
- Depression
- Edge Cracking
- Longitudinal/Transverse Cracking
- Joint reflection cracking
- Patching and Utility Cut Patching
- Potholes
- Rutting*
- Shoving*
- Slippage Cracking*
- Raveling
- Weathering

Portland Cement Concrete (PCC) Pavement:

- Blowup/ Buckling
- Corner Break*
- Divided Slab*
- Durability Cracking*
- Patching (Large and Small)
- Linear Cracking
- Popouts
- Pumping
- Punchout*
- Scaling
- Spalling (Corner and Joint)

*Indicates load-related distresses

A more detailed description of each distress type is available in ASTM D6433-16² and photographs of some common distresses are shown in the following figures.

Figure 1 shows examples of common distresses found in AC pavement.

Spalling

Figure 2: Common Distresses for PCC Pavement

The definitions of the pavement condition categories and PCI ranges are identified in Table 1 and Figure 3. As noted below, streets in a “Fair” condition includes streets with both non-load related (block cracking, weathering or raveling) and load related (alligator cracking, rutting) distresses. Since the appropriate treatments for these conditions are different, they are separated into distinct categories and generally, streets with load-related distress are more expensive to repair. The two categories of a “Fair” condition pavement are identified by II (non-load related) and III (load related) and further explained in Table 1 below. StreetSaver® will assign the appropriate treatments and costs to streets identified within each category.

Table 1: Pavement Condition Categories

Condition Category		PCI	Pavement Description
(I)	Good	71-100	Pavements which have little or no surface distress (except utility patches if any), including minimal hairline longitudinal/transverse cracks and/or weathering. The pavement structure is sound and minor oxidation may occur.
(II)	Fair, Non-Loaded	51-70	Pavements which have a significant level of distress that is predominantly non-load related such as longitudinal/transverse cracks, bleeding, block cracking, weathering and raveling, etc. The pavement structure is sound and some oxidation has occurred.
(III)	Fair, Load-Related	51-70	Pavements which have a significant level of distress that are predominantly load related such as alligator cracking and minor rutting, etc. The pavement structure is becoming deficient (minimal base failure).
(IV)	Poor	26-50	The pavement has moderate to severe surface distresses. Extensive weathering or raveling, block cracking, and load-related distresses such as alligator cracking, rutting, and potholes may occur.
(V)	Very Poor	0-25	The pavement has severe weather-related distress as well as large quantities of load-related distresses. The pavement is nearing the end of its service life.

Figure 3: Pavement Condition Categories

Examples of various PCI's for AC and PCC streets are shown in the photographs in Figure 4 and 5 respectfully.

The photographs in Figure 4 illustrate the City's AC streets and show a range of PCIs.

Figure 4: Examples of AC Streets with Different PCIs

The photographs in Figure 4 illustrate the City's PCC streets and show a range of PCIs.

Figure 5: Examples of PCC Streets with Different PCIs

The City's average weighted (by area)³ PCI is 67; this is considered to be in a "Fair" condition. However, the average PCI does not completely describe the City's street network. A better representation of the overall network condition includes a breakdown by the functional class as shown in Table 2.

Table 2: Pavement Network and Condition Summary by Functional Class

Functional Class	Centerline Mileage	# of Sections	Pavement Area (sf)	% Pavement Area	Weighted Average PCI
Arterial	8.0	71	2,220,348	14.5%	67
Collector	7.6	110	1,428,018	9.3%	76
Residential	84.5	1,060	11,639,863	76.1%	65
Total	100.1	1,241	15,288,229	100.0%	67

Table 3 shows the pavement network breakdown by surface types and the PCC streets account for approximately 6.1 percent of the overall pavement area and are in a slightly better condition than the AC streets.

Table 3: Pavement Network and Condition Summary by Surface Types

Surface Type	Centerline Mileage	# of Sections	Pavement Area (sf)	% Pavement Area	Weighted Average PCI
AC	91.4	1,080	14,355,081	93.9%	67
PCC	8.7	161	933,148	6.1%	69
Total	100.1	1,241	15,288,229	100.0%	67

Table 4 shows the distribution of pavements by functional class and condition category. Almost half (48.7 percent) of the City's streets are in "Good" condition while 20.1 percent are in either a "Poor" or a "Very Poor" condition.

Table 4: Pavement Condition Breakdown by Functional Class and Condition Category

Condition Category	PCI Range	Arterial	Collector	Residential	Entire Network
Good (I)	70-100	6.2%	6.2%	36.3%	48.7%
Fair (II/III)	50-69	6.0%	1.7%	23.5%	31.2%
Poor (IV)	25-49	1.3%	1.4%	10.9%	13.7%
Very Poor (V)	0-24	1.0%	0.0%	5.4%	6.4%
Total (%)		14.5%	9.3%	76.1%	100%

Appendices B through G contain the PCI listing for all vehicular streets in the City.

³ The weighted average PCI is a result of multiplying the area of each street section by the PCI of that section, totaling all sections together and then dividing by the total of the network areas or functional classification.

Figure 6 depicts the overall pavement network and shows percentage of the network in each condition category.

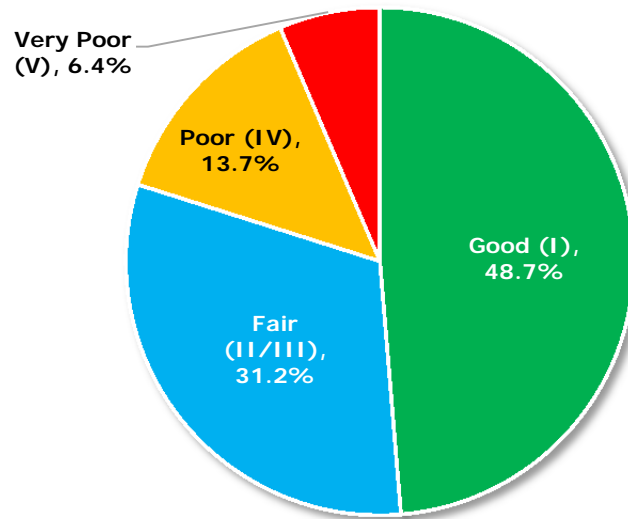

Figure 6: Pavement Network Breakdown by Condition Category

Figure 7 illustrates PCI comparisons between Manhattan Beach and the surrounding coastal cities using information gathered from the 2016 California Statewide Local Streets and Roads Needs Assessment. As shown, the City's average network PCI is slightly higher than the statewide average which is 65.

Figure 7: PCI Comparison with Other Agencies

Current Maintenance and Rehabilitation Practices

In meetings with City staff, alternative treatment approaches were discussed with the underlying philosophy of keeping good streets in good condition while also rehabilitating and reconstructing poor streets as allowed by the available budget.

Preventive maintenance treatments such as slurry seals or microsurfacing are suitable for AC pavements in the "Good" condition category and should be applied every five to seven years if the pavement condition is appropriate. Slurry sealing is a process where an asphalt emulsion is mixed with fine aggregate and additives and placed in a thin layer to seal, fill, and renew pavement surfaces and protect it against moisture and the sun. As a result, slurry seal generally improves the section's PCI but does not reset it to 100. Note that the decision tree has a PCI cap at 90 which means that no treatment will be applied to a section with a PCI of 90 or above.

When the pavement condition deteriorates to lower PCIs, overlays and cold in-place recycling treatment should be performed and these are considered "rehabilitation or reconstruction" treatments. In addition, base repairs or localized dig-outs are commonly used as preparatory work prior to overlays. These treatments will reset the section's PCI back to 100 since the structural integrity has been restored. It is important to note that the pavement condition will continue to deteriorate from 100 as usual after the treatment has been applied.

The current strategy for PCC streets is full or partial conventional slab replacement.

The M&R decision tree is developed and serves as a basis for the various funding scenarios. It determines when a street section should be treated, type of treatment, and cost of treatment. For example, if Highland Avenue has a PCI of 35, and the appropriate treatment is a 2.5" asphalt rubber hot mix (ARHM) overlay with approximately 10 percent digouts, then the area of the pavement section is multiplied by the unit cost and the total treatment cost determined. Additional maintenance treatments over the next seven years may also be applied (e.g. slurry seal) to preserve it. Any changes to the decision tree will cause the existing budget analysis result to become invalid.

Figure 8 illustrates that pavement maintenance follows the old colloquial saying of "pay now or pay more later". History has shown that it costs much less to maintain streets in good condition than to repair streets that have failed. By letting pavements deteriorate, streets that once cost \$3.00 per square yard (SY) to seal may, in a few years, cost as much as \$52.00 per SY to reconstruct.

The pavement deterioration curve shown by the blue line describes how pavements deteriorate over time. In general, arterials will be expected to have a service life of 20 years, while those for residential streets may exceed 30 years.

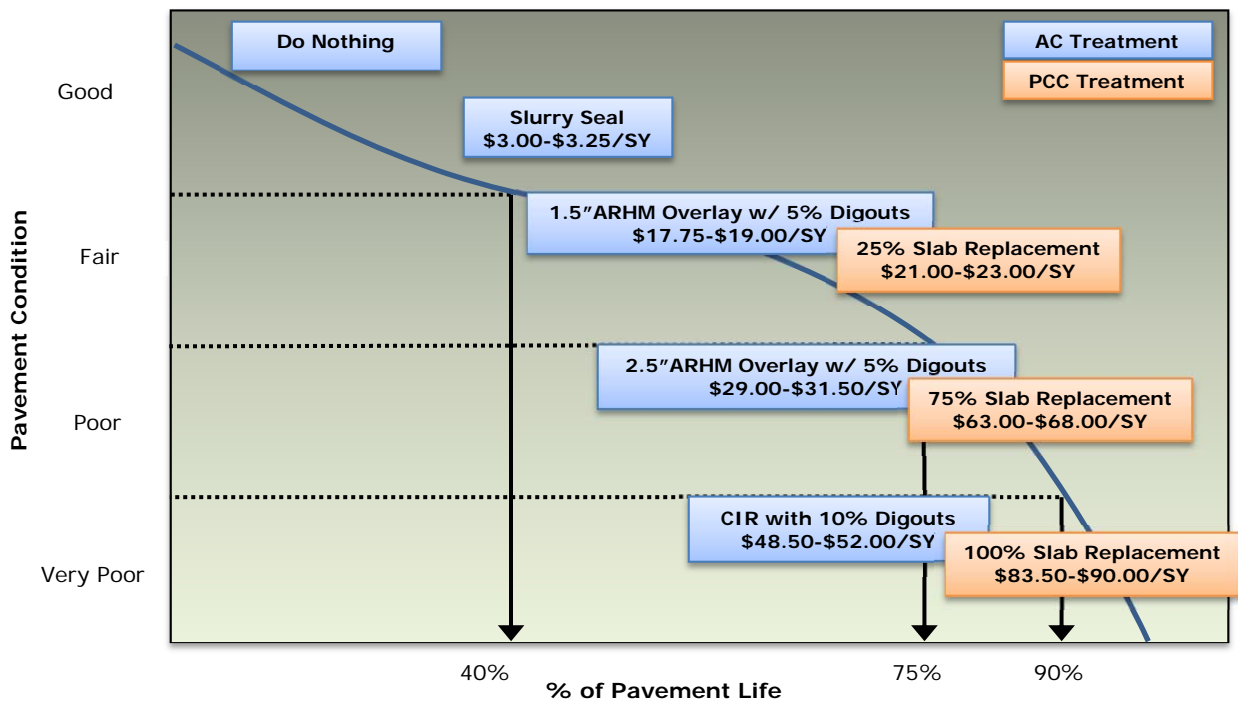

Figure 8: Costs of Maintaining Pavements over Time

Budget Needs

Once the pavement condition and the appropriate maintenance treatments have been determined, then it is possible to establish the funding needs for the City's streets. Simplistically, the StreetSaver[®] program seeks to answer the following questions:

If funding is not a constraint, how much money is needed to bring the pavement condition to a state of good repair?

StreetSaver[®] will determine the amount of funding required for the street network to achieve an optimal level based on the policy established in the decision tree. For each street section, the software projects the PCI value without treatment, assigns applicable treatments, and calculates the costs of the treatment(s) over the analysis period by multiplying the unit cost by the pavement section area. This procedure uses section description data, PCI values, and the established decision tree.

Based on the strategies outlined in the decision tree, StreetSaver[®] determines the appropriate treatment for each street section in the first year. Since not every street requires a treatment and some only need a slurry seal, the resulting network PCI will increase to 88 instead of 100 during the first year. Using this process, the entire street network for the City was evaluated for each subsequent year. A street begins to deteriorate immediately after treatment and as a result, subsequent preventive maintenance may be required per the decision tree.

StreetSaver[®] calculates total budget needs of approximately \$22.5 million over the next seven years at an annual inflation rate of three percent. If the City follows the funding strategy recommended by the program, the average PCI will increase to the low 80s. In essence, the maintenance needs summarized in Table 5 illustrates the level of expenditures required to improve the pavement condition to a state of good repair.

Table 5: Results of Budget Needs

Fiscal Year	18/19	19/20	20/21	21/22	22/23	23/24	24/25	Total
Rehabilitation Needs (\$M)	17.7	0.6	1.2	0.0	0.0	0.0	0.0	19.5
Preventive Maintenance Needs (\$M)	1.1	0.3	0.6	0.1	0.1	0.6	0.3	3.0
Total Budget Needs (\$M)	18.8	0.9	1.7	0.1	0.1	0.6	0.3	22.5
Treated PCI	88	85	86	84	83	82	81	N/A

Since it is less expensive to maintain good streets than poor streets, the budget needs module aims to place all street sections in a "Good" category. As a result, the total budget needs are "front-loaded", as it is cheaper to repair the streets in the first year than in subsequent years due to the effect of deferring maintenance and inflation. This principle is reflected in the result of Table 5 as the PCI drops from 88 to 81 by the end of the analysis period. After front-loading \$18.8 million in the first year, the majority of

the streets would be in a “Good” condition. However, the condition of these streets will continue to degrade until it eventually reaches a point where a treatment is needed. The first year’s budget needs of \$18.8 million is the City’s current deferred maintenance. Furthermore, street section that does not require a treatment during that first year might appear later in subsequent years. Although very few agencies can afford this “front-loaded” approach, it highlights the next treatments each street section needs and becomes a reference point for the other funding scenarios.

Of the \$22.5 million in the seven-year maintenance needs, approximately \$3.0 million is programmed for preventive maintenance, while roughly \$19.5 million is allocated for more costly rehabilitation and reconstruction treatments over the next seven years.

Budget needs also directly correlates to deferred maintenance, which is pavement preservation and rehabilitation activities that are needed but cannot be performed due to lack of funding. It can also be referred to as the unfunded backlog; essentially, deferred maintenance is the deficit derived from budget needs after the City exhausts its available budget. Shrinking budgets have forced many cities and counties to defer much needed pavement maintenance activities. By deferring these activities, not only does the frequency of resident complaints about the condition of the pavement network increase, but the cost to repair these streets rises as well.

It should be noted that the prediction models in StreetSaver® may result in a more conservative performance because the impacts of the use of newer and more cost-effective technologies are not included. For example, if improved materials are utilized, e.g. asphalt-binder with rubber or polymers, the actual performance of these treatments may be under-stated by the models. However, if the City continues to assess the pavement conditions regularly, the prediction of future conditions will continue to improve.

Budget Scenarios

Having determined the seven-year maintenance needs of the City's street network, the next step in developing a cost-effective M&R strategy is to conduct a "what-if" analysis. Using the StreetSaver® budget scenario module, the impacts of the City's budget can be evaluated. This module seeks to answer the following questions:

If funding is constrained, what is the most cost-effective way to spend the funds? What are the consequences on the PCI and deferred maintenance? Which streets will be prioritized for repairs and when will they be repaired?

The program determines the effects of the different funding scenarios on PCI and deferred maintenance. By examining the effects on these performance measures, the advantages and disadvantages of different funding levels and maintenance strategies become clear. The following scenarios were performed:

Scenario 1: City's Budget (\$1.585 Million per year) – A projected M&R budget of approximately \$1.585 million per year is expected to increase the network PCI to 72 and the deferred maintenance will decrease from \$18.8 million to \$14.1 million by fiscal year (FY) 2024/25.

Scenario 2: Maintain PCI at 67 (\$900,000 per year) – An annual budget of approximately \$900,000 will be required to maintain the network PCI at 67 over the next seven years. However, the deferred maintenance will increase to \$20.5 million by FY 2024/25.

Scenario 3: Improve PCI to 76 (\$2.2 Million per year) – In order to improve the overall network PCI to 76, the City needs to spend approximately \$2.2 million annually over the next seven years. The deferred maintenance would be reduced by half to approximately \$9.1 million by FY 2024/25.

Scenario 4: Improve PCI to 80 (\$2.8 Million per year) – With an annual paving budget of \$2.8 million, the network PCI will gradually improve to 80 over the next seven years. Furthermore, the deferred maintenance will decrease to \$4.4 million by FY 2024/25.

Scenario 5: No Funding (\$0 per year) – This scenario illustrates the effect of 'do nothing'. The Citywide average PCI will deteriorate to 57 and the deferred maintenance will increase to \$32.7 million by FY 2024/25.

Scenarios 1 to 4 assume that the upcoming rehabilitation projects on Highland Avenue, Manhattan Avenue, Marine Avenue, and the Liberty Village neighborhood will be completed by the summer of 2019. The result of these planned projects is not reflected in the "current" year but will show up in the first two years after they are completed.

More detailed results of the budget needs and scenarios can be found in Appendix H, I, and J.

Scenario 1: City's Budget (\$1.585 Million per year)

The City's projected annual paving budget is \$1.585 million includes \$500,000 for residential street rehabilitation, \$700,000 for arterial street rehabilitation, and \$385,000 allocated for preventive maintenance work such as slurry seal. At this funding level, the network PCI will increase to 72 and maintain it at that level over the next seven years. Similarly, the deferred maintenance will decrease from \$18.8 million to \$14.1 million in FY 2024/25. By the end of the analysis period, 83.3 percent of the streets will be in the "Good" condition category, 0.5 percent will in the in "Fair" while 16.2 percent will be in "Poor" or "Very Poor" categories. Table 6 and Figure 9 summarize the results from Scenario 1. Appendix I lists the sections selected for treatment based on the City's budget.

Table 6: Summary of Results for Scenario 1

Fiscal Year	Current	18/19	19/20	20/21	21/22	22/23	23/24	24/25	Total
Budget (\$M)	N/A	1.585	1.585	1.585	1.585	1.585	1.585	1.585	11.095
Rehabilitation (\$M)	N/A	1.200	1.200	1.200	1.200	1.200	1.200	1.200	8.400
Preventive Maintenance (\$M)	N/A	0.385	0.385	0.385	0.385	0.385	0.385	0.385	2.695
Deferred Maintenance (\$M)	18.8	13.4	13.6	14.4	14.3	13.9	13.9	14.1	N/A
Treated Network PCI	67	73	72	73	72	72	72	72	N/A

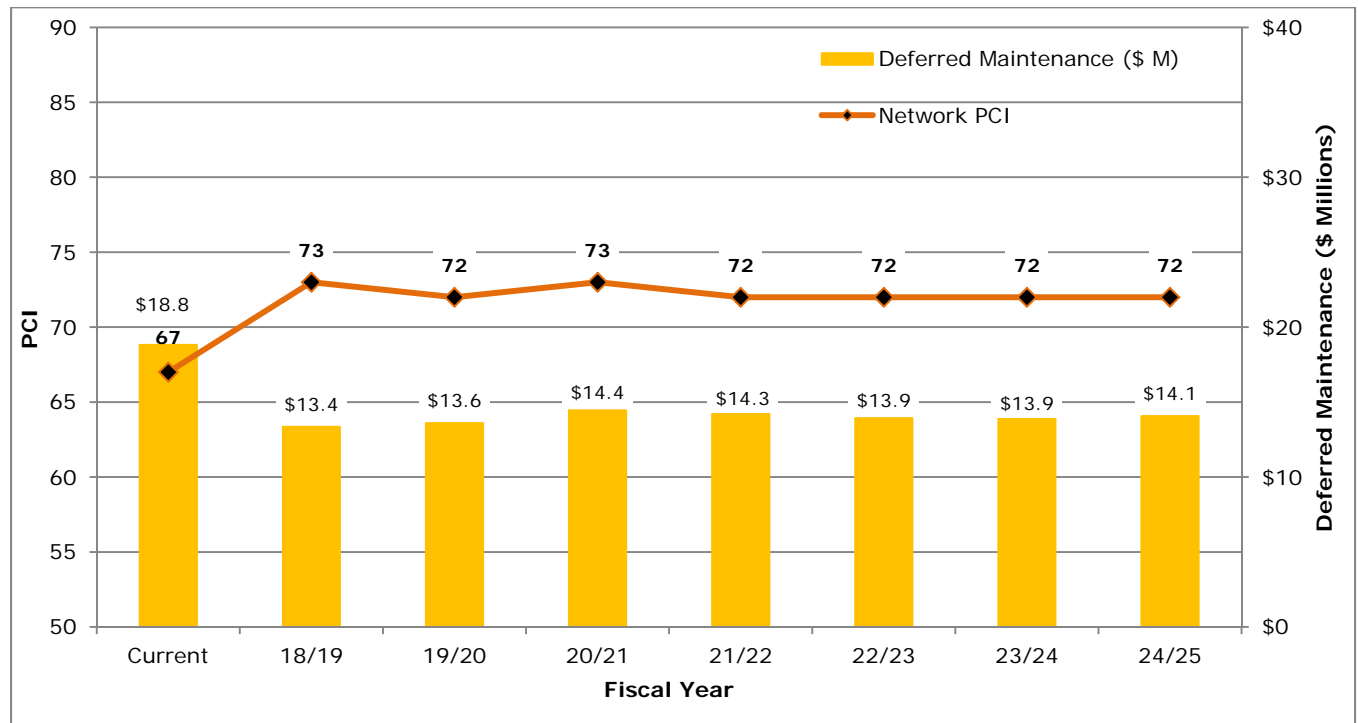

Figure 9: PCI vs. Deferred Maintenance for Scenario 1

Scenario 2: Maintain PCI at 67 (\$900,000 per year)

In order to maintain the network PCI at 67, the City will need to spend approximately \$900,000 annually over the next seven years. Due to the aforementioned projects described on page 15, the network PCI increases from 67 to 72 in the first year. This PCI increase disappears over the next six years with the annual budget of \$900,000. This funding level is insufficient to do more than just maintain the PCI at 67. Streets that are in need of rehabilitation treatments will continue to deteriorate and by the end of the analysis period, the amount of streets in “Very Poor” category almost double from 6.4 percent to 11 percent. As a result, the deferred maintenance continues to increase to \$20.5 million by FY 2024/25 since it costs more to repair them. Table 7 and Figure 10 summarize the results from Scenario 2.

Table 7: Summary of Results for Scenario 2

Fiscal Year	Current	18/19	19/20	20/21	21/22	22/23	23/24	24/25	Total
Budget (\$M)	N/A	0.9	0.9	0.9	0.9	0.9	0.9	0.9	6.3
Rehabilitation (\$M)	N/A	0.6	0.6	0.6	0.6	0.6	0.6	0.6	4.2
Preventive Maintenance (\$M)	N/A	0.3	0.3	0.3	0.3	0.3	0.3	0.3	2.1
Deferred Maintenance (\$M)	18.8	14.0	15.1	16.9	17.7	18.4	19.5	20.5	N/A
Treated Network PCI	67	72	70	70	69	68	68	67	N/A

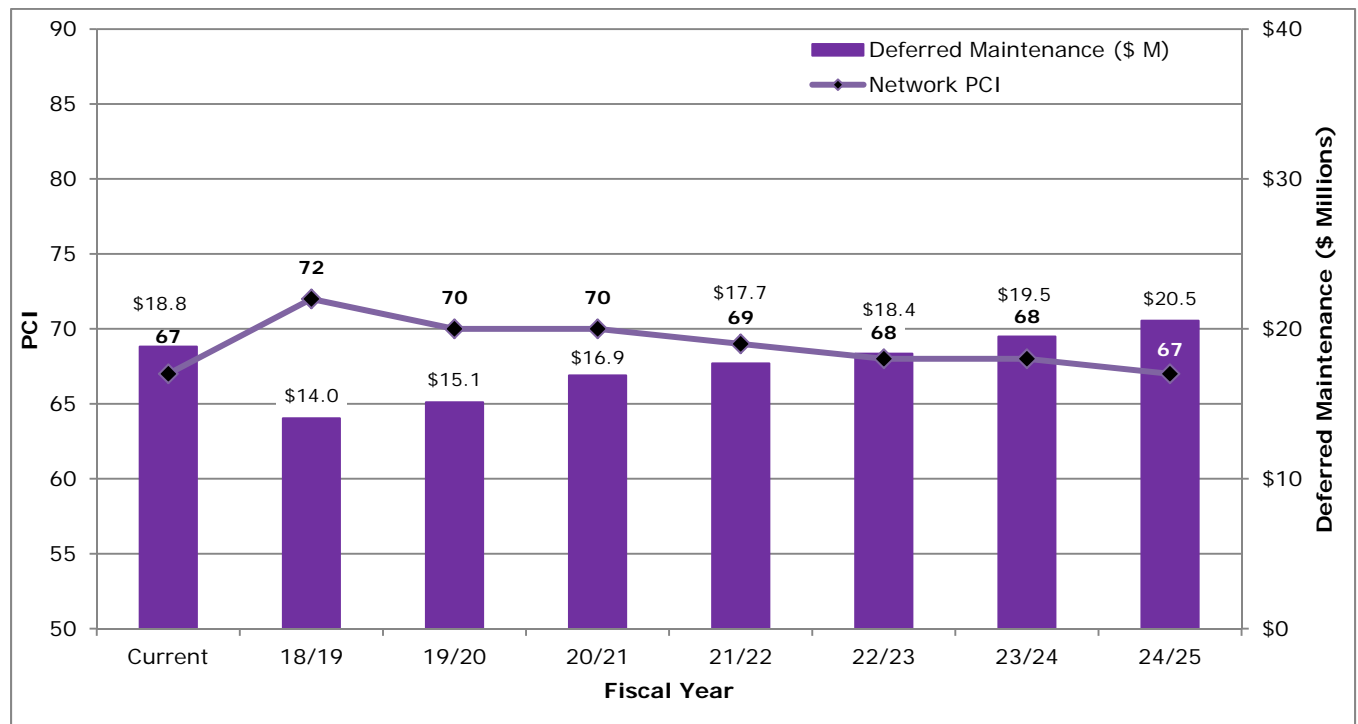

Figure 10: PCI vs. Deferred Maintenance for Scenario 2

Scenario 3: Improve PCI to 76 (\$2.2 Million per year)

An annual paving budget of approximately \$2.2 million is required in order to gradually improve the overall network PCI condition to 76 over the next seven years. At this funding level, the deferred maintenance will decrease to approximately \$9.1 million by FY 2024/25. At the end of the analysis period, 89.4 percent of the streets will be in the “Good” condition category, 0.4 percent will in the in “Fair”, and 10.2 percent in “Poor” or “Very Poor” categories. Table 8 and Figure 11 summarize the results from Scenario 3.

Table 8: Summary of Results for Scenario 3

Fiscal Year	Current	18/19	19/20	20/21	21/22	22/23	23/24	24/25	Total
Budget (\$M)	N/A	2.2	2.2	2.2	2.2	2.2	2.2	2.2	15.4

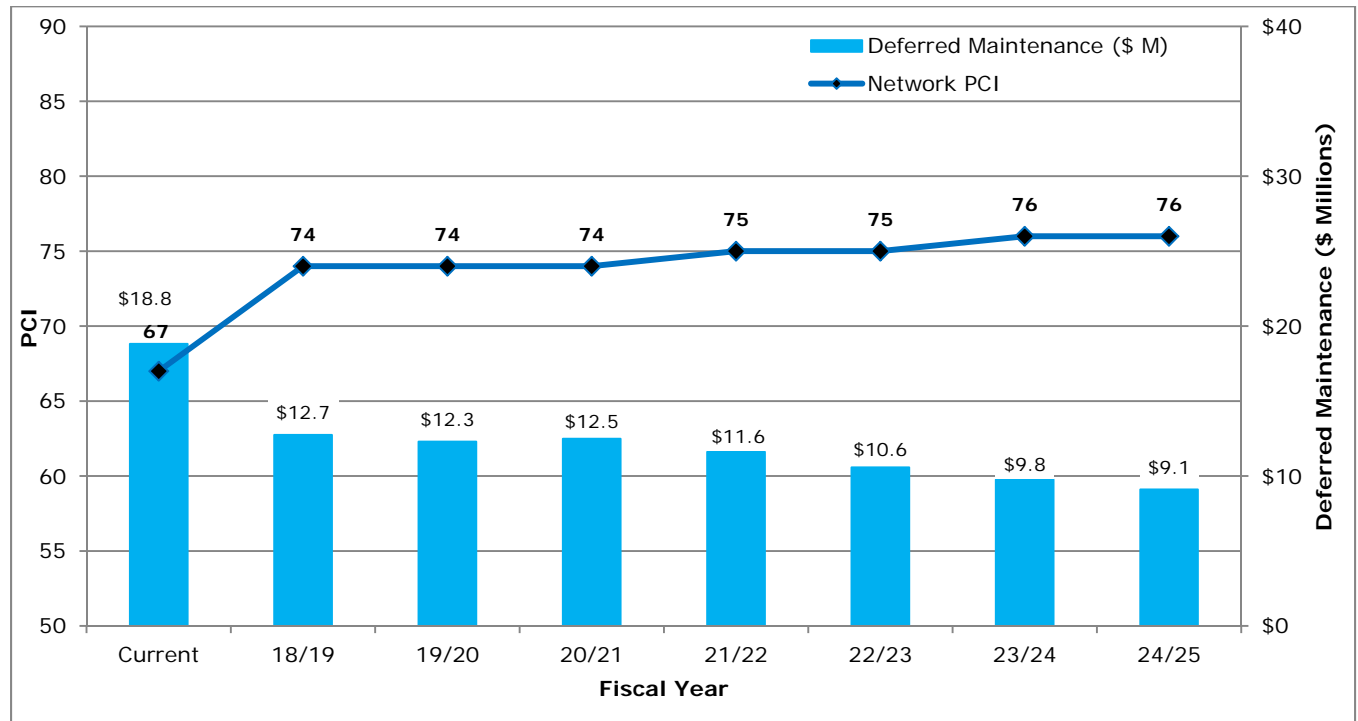

Figure 11: PCI vs. Deferred Maintenance for Scenario 3

Scenario 4: Improve PCI to 80 (\$2.8 Million per year)

Approximately \$2.8 million annually is required in order to improve the citywide average PCI to 80 over the next seven years. The deferred maintenance will gradually decrease to \$4.4 million by FY 2024/25. At the end of the analysis period, 95.4 percent of the streets will be in the “Good” condition category, 0.4 percent will in the in “Fair” while 4.2 percent will be in “Poor” or “Very Poor” categories. Table 9 and Figure 12 summarize the results from Scenario 4.

Table 9: Summary of Results for Scenario 4

Fiscal Year	Current	18/19	19/20	20/21	21/22	22/23	23/24	24/25	Total

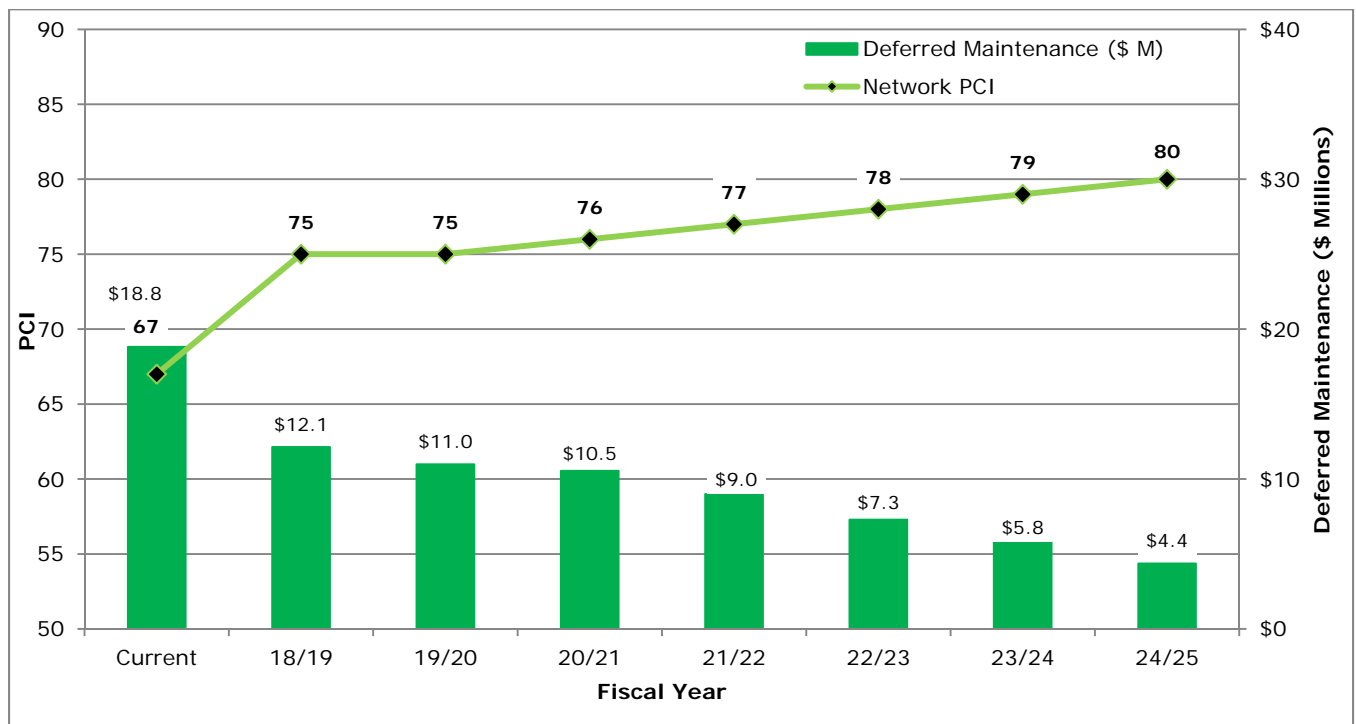

Figure 12: PCI vs. Deferred Maintenance for Scenario 4

Scenario 5: No Funding (\$0 per year)

If there is no funding for any street M&R projects over the next seven years, the network PCI will decrease to 53 and the deferred maintenance will increase to \$38.3 million by FY 2024/25. Furthermore, approximately 39.6 percent of the streets will be in the “Good” condition category, 24 percent will in the in “Fair” while 36.4 percent will be in “Poor” or “Very Poor” categories. Table 10 and Figure 13 summarize the results from Scenario 5.

Table 10: Summary of Results for Scenario 5

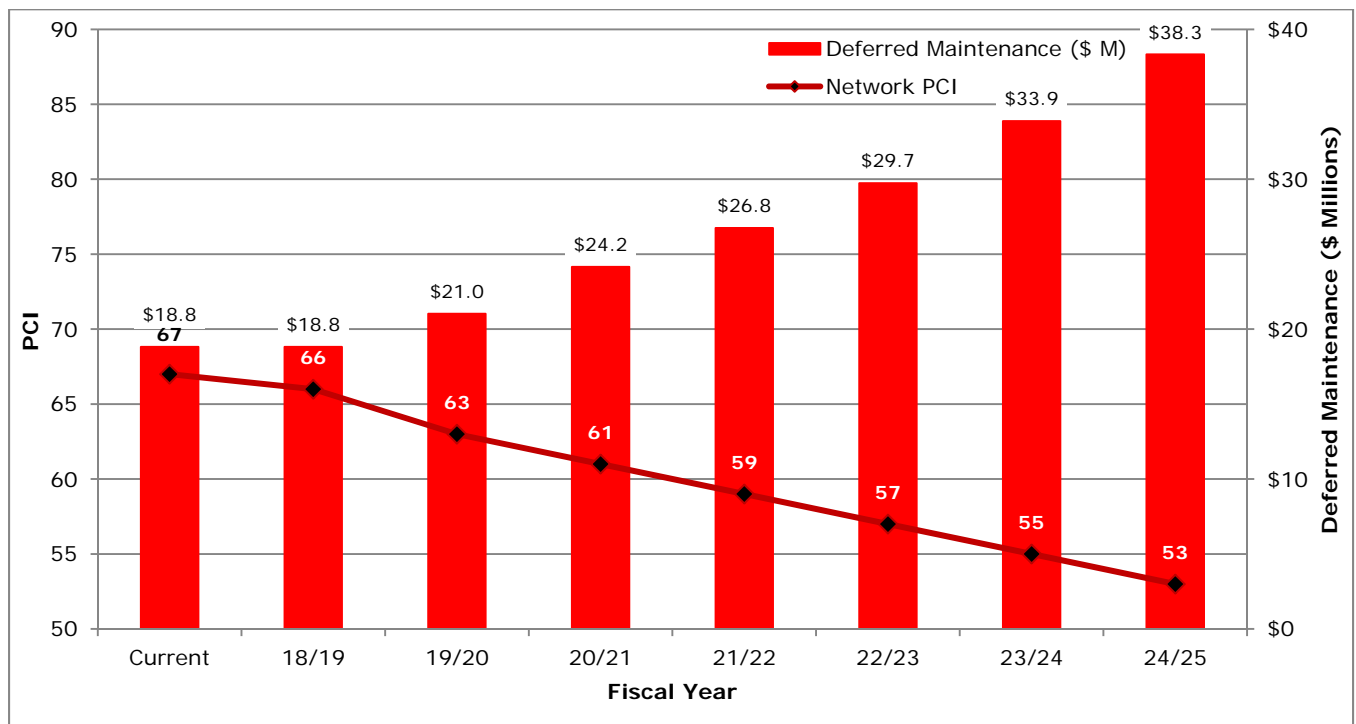

Figure 13: PCI vs. Deferred Maintenance for Scenario 5

Summary

Figure 14 compares the resulting PCIs for each of the scenarios. The City's current annual budget of \$1.585 million (Scenario 1) will increase the network PCI to 72 over the next seven years. Scenario 2 illustrates that an annual budget of \$900,000 will be required to maintain the pavement at the existing condition over the next seven years. However, there is a clear downward trend and the network PCI might be lower than 67 after FY 2024/25. Scenarios 3 and 4 illustrate that the City would need to spend between \$2.2 million to \$2.8 million annually over the next seven years in order to increase the network PCI to 76 and 80 respectively. The results of Scenarios 1 – 4 are dependent upon the completion of projects that are already in the design and construction stages which tentatively scheduled for summer 2019 completion. Finally, the impact of no funding is shown in Scenario 5. GIS maps showing the City's current PCI condition as well as the projected FY 2024/25 conditions for these Scenarios are included in Appendix K.

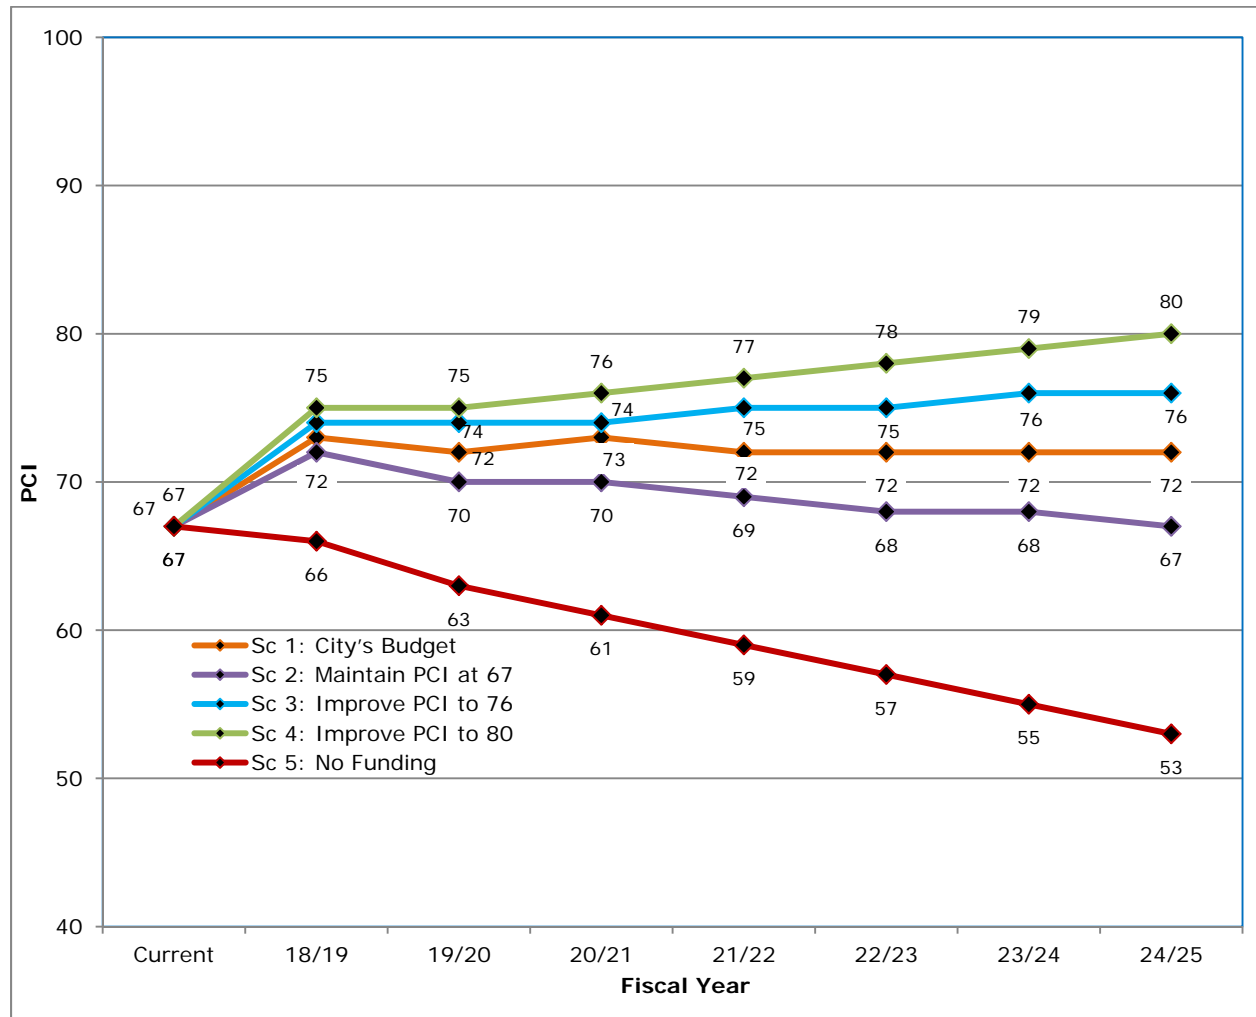

Figure 14: PCI Comparisons between Scenarios

Figure 15 illustrates that the City’s projected annual budget (Scenario 1) will result in a 25 percent drop in deferred maintenance over the next seven years. Funding shown in Scenario 2 will increase deferred maintenance to approximately \$20.5 million while funding levels in Scenario 2 and 3 will continue to reduce the deferred maintenance. Finally, if no streets receive any treatment over the next seven years, the deferred maintenance will more than double to approximately \$38.3 million by FY 2024/25. The sharp decline in deferred maintenance between Year 1 and 2 found in Scenarios 1 to 4 stem from the scheduled rehabilitation work on Highland Avenue, Manhattan Avenue, Marine Avenue, and the Liberty Village neighborhood.

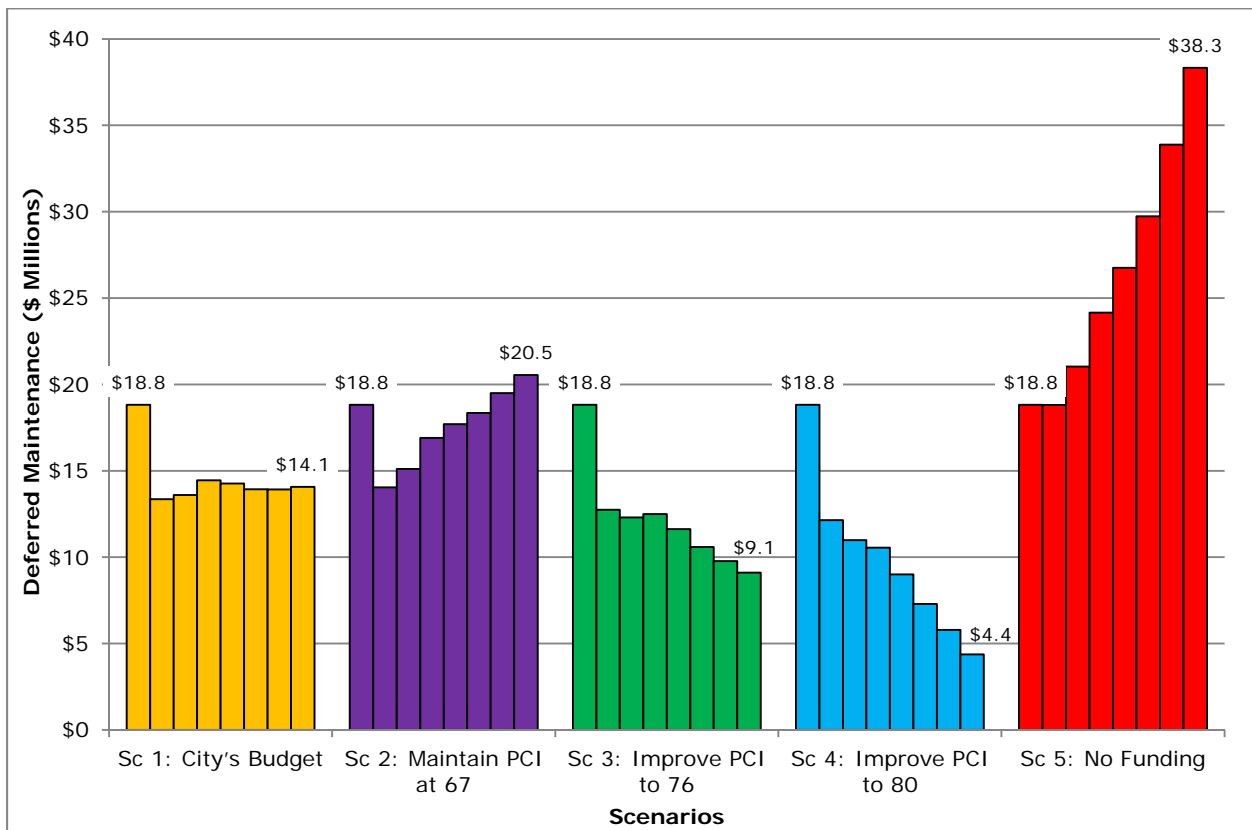

Figure 15: Deferred Maintenance Comparisons between Scenarios

Figure 16 on the next page compares the change in the pavement condition distribution for each of the budget scenarios. Currently, approximately 20.1 percent of the street network falls into “Poor” or “Very Poor” condition category.

In Scenario 1, the amount of “Poor” and “Very Poor” streets will decrease to 16.2 percent. As the funding increases in Scenarios 2 and 3, more streets in the “Poor” category will be rehabilitated and most streets in “Good” category will be surface sealed, resulting in significant improvements in the pavement condition. If no funding is available, amount of “Poor” and “Very Poor” streets will grow to 36.4 percent, furthermore, the amount of “Good” streets will reduce from 48.7 percent to 39.6 percent.

Figure 16: Resulting Pavement Network Condition Breakdown for Budget Scenarios

Conclusions

The City of Manhattan Beach has a substantial investment in its vehicular street network, with an estimated replacement cost of more than \$87.1 million. Overall, the network is in “Fair” condition with a citywide average PCI of 67. PCC streets account for approximately 6.1 percent of the entire pavement area and have an average PCI of 69 while AC streets have an average PCI of 67. Currently, 20.1 percent of the City’s vehicular streets fall in either the “Poor” or “Very Poor” condition category. The current projected pavement maintenance budget of approximately \$1.585 million per year will increase the network PCI to 72 while also decreasing the deferred maintenance to \$14.1 million over the next seven years.

a. Pavement Funding

The City’s projected annual funding level for pavement maintenance is approximately \$1.585 million with \$385,000 allotted for preventive maintenance treatments such as slurry seal. At this funding level, the network PCI will increase to 72 by FY 2024/25. Furthermore, the deferred maintenance will decrease to \$14.1 million.

If sufficient funding is unavailable for street M&R, the average PCI is expected to decrease and the deferred maintenance or unfunded backlog will increase. The higher backlog will result in increased future costs as more capital intensive treatments (such as reconstruction) will be required. Repairs are deferred until less expensive treatments (such as surface seals or overlays) are no longer effective.

As the results show in Scenario 1, the City’s current funding level is sufficient for the network given that the scheduled street rehabilitation projects on Highland Avenue, Manhattan Avenue, Marine Avenue, and the Liberty Village neighborhood will be completed by the summer of 2019.

It should be noted that a significant unknown is the future cost of rehabilitation; with the volatility in oil prices, we would recommend that the City carefully monitor future construction costs and be ready to adapt to large increases if necessary. As a result, NCE recommends that the City considers increasing its current funding level of \$1.585 million (Scenario 1) by approximately three to five percent annually at a minimum keep up with inflation as well as general construction costs escalation.

b. Pavement Maintenance Strategies

Since nearly half (48.7 percent) of the City’s vehicular street network fall in the “Good” condition category, it is important to preserve these good pavements. Therefore, NCE recommends that the City adopts a well-funded preventive maintenance program, utilizing treatments such as slurry seals and microsurfacing while increases funding for rehabilitation at the same time.

The City's current strategy for PCC streets is slab replacement which can be relatively cost prohibitive considering they cover approximately 6% of the City's entire pavement area. If the concrete section does not exhibit extensive structural-related failure, diamond grinding is a surface restoration technique to correct a variety of surface distresses and is a cost-effective extension of pavement life (8 to 15 years⁴). Large air voids found underneath a slab will accelerate the deterioration process since they establish insufficient structural support. Slab stabilization is a process of injecting cement grout and polyurethane or other suitable materials through drilled holes in the concrete located over the void areas to improve support for the slab. To prevent water and other foreign substances from entering joints or cracks, a variety of crack and joint sealants, can also be considered.

c. Re-inspection Strategies

In order to monitor future pavement performance and on-going maintenance needs, the Los Angeles County Metropolitan Transportation Authority (Metro) requires an inventory of city maintained arterial and collector streets in order to be eligible for Prop C funds. This inventory update should be done on the triennial basis. Furthermore, NCE recommends that the City inspect the residential street network every 5 to 6 years.

d. Maintenance and Rehabilitation Decision Tree

The M&R decision tree and the associated unit costs should be reviewed and updated annually to reflect new construction techniques and changing costs so the funding analysis remains reliable and accurate.

e. Next Steps

To summarize, we recommend that the City consider the following steps:

- Establish a well-funded preventive maintenance program.
- As maintenance treatments change, the City should seek alternative treatments in order to "stretch" the dollar.
- Update the PMP every three years to meet Metro's requirements.
- Review and update the M&R decision tree and associated unit costs annually.
- Increase current funding level of \$1.585 million by at least three to five percent per year. Below are some examples of funding sources available:

Federal

- Surface Transportation Program (STPL)
- Congestion Mitigation & Air Quality Improvement (CMAQ)
- Surface Transportation Block Grant Program

⁴ U.S Department of Transportation Federal Highway Administration "Concrete Pavement Preservation Guide" Second Edition. September, 2014.

- Highway Safety Improvement Program (HSIP)

State

- State Transportation Improvement Program (STIP)
- Active Transportation Program (ATP)
- Vehicle License Fee (VLF)
- CalRecycle grants
- Transportation Development Act (TDA)

Local

- General funds
- Local sales taxes
- Development Impact Fees
- Traffic impact and transportation mitigation fees
- Utility tax
- Parking and various permit fees
- Parcel taxes

Section Description Inventory Entire Street Network

Sorted by Street Name

Section Description Inventory Report

This report lists a variety of section description information for each of the City's pavement sections. It lists the street and section identifiers, limits, functional class, surface type, number of lanes, lengths, widths, and inspected 2018 PCI.

All of the City's vehicular street sections are included in the report. The report is sorted alphabetically by Street Name and Section ID and by descending PCIs. The field descriptions in this report are listed on the next page.

Header	Description
STREET ID	Street identification in StreetSaver® unique for each street
STREET NAME	The name of the street as indicated by street signs in the field
SECTION ID	Section identification number in StreetSaver® unique for each section of one street
BEG LOCATION	Beginning limit of the section
END LOCATION	Ending limit of the section
FC	Functional Classification (UPAO – Urban Principle Arterial-Other, MiA – Minor Arterial, C - Collector, MiC – Minor Collector, R – Residential/Local)
SURFACE TYPE	Surface Type (AC = Asphalt Concrete Pavement, AC/AC = AC Overlay of AC Pavement, PCC = Portland Cement Concrete Pavement)
LANES	Number of lanes of the section
LENGTH (FT)	Length of the section in feet
WIDTH (FT)	Average width of the section in feet
AREA (SF)	Area of the section in square feet
AREA ID	Neighborhood/Zone identification
INSPECTED DATE	Last pavement inspection date
INSPECTED PCI	Average PCI for the section.

Appendix G

Maintenance and Rehabilitation (M&R) Decision Tree

Maintenance and Rehabilitation Decision Tree

This report presents the current maintenance and rehabilitation (M&R) decision tree that exists in the database. The decision tree forms the basis for all of the budgetary computations that are included in this volume. ***Changes to the decision tree will make the results in the budget reports invalid.*** All pavement treatment unit costs relevant to the street types in the database were updated.

The decision tree lists the treatments and costs selected for preventive maintenance and rehabilitation activities. Each line represents a specific combination of functional classification and surface type.

The preventive maintenance portion of the report is identified as Condition Category I – Very Good. All preventive maintenance treatment listings are assigned only to sections in Condition Category I where the PCI is in between 70 to 90. Street sections with PCI values less than 70 are assigned to treatments listed in Categories II through V.

In the preventive maintenance category ($PCI \geq 70$), a time sequence is used to identify the appropriate treatment and cost. Each preventive maintenance treatment description consists of three parts: 1) a CRACK treatment, 2) a SURFACE treatment, and 3) a RESTORATION treatment. These three parts allow the user to specify one of three different preventive maintenance treatments depending on the prior maintenance history of the section.

1. The CRACK treatment part can be used to specify the most frequent type of preventive maintenance activity planned (typically crack seals).
2. The SURFACE treatment part can be used to specify more extensive and less frequent preventive maintenance activities, such as chip seals or slurry seals. For example, a crack seal can be specified on a 3-year cycle with a slurry seal specified after seven years.
3. The RESTORATION part can be used to specify a surface restoration treatment (such as an overlay) to be performed after a specified number of surface treatments. For example, after three successive slurry seals, an overlay can be specified instead of another slurry seal.

Rehabilitation treatments are assigned to sections in Condition Categories II through V. Each line is defined by a specific combination of functional classification, surface type, and condition category.

COLUMN	DESCRIPTION
Functional Class	Functional Classification identifying the branch number.
Surface	Surface Type identifying the branch number. Surface Type (AC = AC Pavement, AC/AC = AC Overlay of AC Pavement, AC/PCC = AC Overlay of PCC Pavement, PCC = PCC Pavement, ST = Surface treatment over gravel base/subgrade).
Condition Category	Condition Category (I through V).
Treatment Type	First Row (Crack Treatment) indicates localized treatment (e.g. crack sealing). Second Row (Surface Treatment) indicates surface treatment (e.g. microsurfacing). Third Row (Restoration Treatment) indicates surface restoration (e.g. overlay).
Treatment	Name of treatments from the "Treatment Descriptions" report.
Cost/SqYd, except Seal Cracks in LF	Average unit cost per square yard for each treatment except for "SEAL CRACKS" which is cost per linear feet.
Yrs. Between Crack Seals	First Row - number of years between successive treatment applications specified in the first row (i.e. CRACK treatment).
Yrs. Between Surface Seals	Second Row - number of years between successive treatment applications specified in the second row (i.e. SURFACE treatment).
# of Surface Seals before Overlay	Number of times that the treatment application in the second row (i.e. SURFACE treatment) will be performed prior to performing the treatment application in the third row.

Treatments highlighted in yellow indicated that a specific functional class and surface combination does not exist within the City (i.e. an AC overlay of PCC pavement arterial street, a surface-treated collector street, etc.). Therefore, treatments for these functional class and surface combination will be "Do Nothing".

Note that the treatments assigned to each section should not be blindly followed in preparing a street maintenance program. Engineering judgment and project level analysis should be applied to ensure that the treatment is appropriate and cost effective for the section.

Budget Needs

- I. Projected PCI/Cost Summary**
- II. Rehabilitation Treatment/Cost Summary**
- III. Preventive Maintenance Treatment/Cost Summary**

Budget Needs Reports

The purpose of this module is to answer the question: ***If the City had all the money in the world, what sections should be fixed and how much will it cost?*** Based on the Maintenance & Rehabilitation (M&R) decision tree and the PCIs of the sections, the program will then select a maintenance or rehabilitation action and compute the total costs over a period of seven years. The Budget Needs represents the "ideal world" funding levels, while the Budget Scenarios reports in the next section represent the most "cost effective" prioritization possible for the actual funding levels.

A budget needs analysis has been performed. The summary results from the analysis are shown below. An interest rate of 3% and an inflation factor of 3% were used to project the costs for the next seven years. This report shows the total seven-year budget that would be required to meet the City's standards as exemplified in the M&R decision tree.

As indicated in the report, with a budget of \$22.5 million over the next seven years the PCI of the street network will improve from the current level of 67 to 81 by fiscal year (FY) 2024/25. If no treatments are programmed, the weighted average PCI is projected to deteriorate to 53 by FY 2024/2025.

Budget Needs reports included in this volume are listed below:

- Projected PCI/Cost Summary
- Preventative Maintenance Treatment/Cost Summary
- Rehabilitation Treatment/Cost Summary

Needs - Projected PCI /Cost Summary

This report summarizes and projects the City’s network PCI values over a seven-year period, both with and without treatments applied. These costs are based on those in the M&R decision tree. It also projects the costs over a seven-year period.

COLUMN	DESCRIPTION
Year	Year in the analysis period.
PCI Treated	Projected network average PCI with all needed treatments applied.
PCI Untreated	Projected network average PCI without any treatments applied.
PM Cost	Total preventive maintenance treatment cost.
Rehab Cost	Total rehabilitation treatment cost.
Cost	The budget required for each year in the analysis period to meet the City’s standard as shown on the M&R decision tree.
Total Cost	Total budget required over a seven-year period.

Needs - Projected PCI/Cost Summary

Inflation Rate = 3.00 % Printed: 06/04/2018

Year	PCI Treated	PCI Untreated	PM Cost	Rehab Cost	Cost	
2018	88	66	\$1,123,618	\$17,692,718	\$18,816,336	
2019	85	63	\$300,215	\$598,432	\$898,647

Attachment - Resumes of Field Inspectors

1. Introduction

When performing data collection in any field, the need for quality control is paramount. This need for quality data is essential for accurate planning, analysis and design. NCE's "Quality Assurance Management Plan" (QAMP) affirms that:

"NCE is dedicated to achieving technical and management excellence and to delivering professional engineering and environmental services that meet or exceed our clients' needs. NCE's Quality Assurance/Quality Control (QA/QC) Program is designed to achieve these goals. This QA Management Plan (QAMP) describes NCE's QA Program, which is based on four principles: client satisfaction, employee participation, problem prevention, and continuous quality improvements."

NCE's QAMP establishes minimum quality standards for performance and procedures for assuring that our clients receive quality service. It requires the participation of employees at every level. It encourages Project Managers and technical staff to take pride in their work and responsibility for ensuring that the work is done correctly the first time. The program is designed to reduce the incidence of problems related to quality and results in implementation, where necessary, of corrective actions and modification of work procedures to minimize the incidence of future problems.

NCE has also prepared detailed and specific Quality Control Plans for projects, and the most notable example is for the **Long Term Pavement Performance (LTPP) – Western Regional Support Contract** for the Federal Highway Administration. This is a 150 page document that covers data collection on highways, including deflection, profile, pavement distresses, traffic, maintenance and rehabilitation history, materials testing and sampling as well as a document control.

1.1. Objectives

This document constitutes a formal Quality Control Plan (QCP) for the City of Manhattan Beach. The focus is on data collection issues as part of the pavement management update.

Specifically, it is intended for the 2018 Pavement Management Update. The focus is on the collection of network-level pavement distress data (defined by NCHRP Synthesis 401 *Quality Management of Pavement Data Collection*, as "Network-level data collection involves collection of large quantities of pavement condition data, which is often converted to individual condition indices or aggregated into composite condition indices.")

1.2. Structure

The following components are addressed in this QCP:

- Condition inspection procedures used
- Accuracy required for data collection
- Inspector qualifications and experience
- Safety

2. Quality Control Plan

2.1. Condition Inspection Procedures

The governing document in performing condition inspections for the City of Manhattan Beach is ASTM D6433-16 “Standard Practice for Roads and Parking Lots Pavement Condition Index (PCI) Surveys.” Both asphalt concrete (AC) and Portland cement concrete (PCC) pavements are included in this protocol. The following distresses are collected for each pavement type.

Asphalt Concrete (AC) Pavements

1. Alligator (fatigue) cracking
2. Bleeding
3. Block cracking
4. Bumps and sags
5. Corrugation
6. Depression
7. Edge cracking
8. Joint reflection cracking
9. Lane/Shoulder drop off
10. Longitudinal and transverse cracking
11. Patching and utility cut patching
12. Polished aggregate
13. Potholes
14. Railroad crossing
15. Rutting
16. Shoving
17. Slippage cracking
18. Swell
19. Weathering
20. Raveling

Portland Cement Concrete (Jointed)

1. Blowup/Buckling
2. Corner breaks
3. Divided slab
4. Durability (“D”) cracking
5. Faulting
6. Joint seal damage
7. Lane/shoulder drop off
8. Linear cracking
9. Patching (large) and utility cuts
10. Patching (small)
11. Polished aggregate
12. Popouts
13. Pumping
14. Punchout
15. Railroad crossing
16. Scaling, map cracking and crazing
17. Shrinkage cracks
18. Spalling (corner)
19. Spalling (joint)

Any exceptions to the above procedures will be discussed with the City before any inspections are performed. These are usually related to distresses or situations that are not covered in the manuals. Examples include slippage cracks, roller check marks or edge cracking on streets with no curbs and gutters. Others include the use of seals or open-graded asphalt concrete mixes. Any modifications will be documented and submitted to the City for approval.

All distress or condition inspections are performed as walking inspections, and a minimum 10% sampling rate is utilized. Field crews are typically composed of a one-person crew, Franc Escobedo, teaming up when required for higher volume facilities such as arterials. The sample units for this project will be based upon the length and width of the street sections. This data will be collected to match the existing management sections of StreetSaver®.

2.2. Accuracy Required For Data Collection

The accuracy required for data collection has two components, both of which are further described in the following paragraphs.

- Re-inspections
- PCI comparisons with past inspections

2.2.1 Re-Inspection “Check”

At least five percent of all inspections are randomly re-inspected by other team members (either Lisa Senn or David Bivins). A different inspector will review these sites and determine the revised pavement distress measurements. If the initial inspection is determined to be inaccurate, the original inspector is given refresher training before being allowed to continue with any further inspections. Should the data be inaccurate for a certain day, all the data for that day will be re-inspected following refresher training to ensure accuracy.

Acceptability Criteria

At the time of re-inspection, the actual distresses will be re-inspected and verified, and any corrections made, if necessary. Distress types and severities must be the same and re-measured quantities within $\pm 10\%$ of the original measured quantity.

If corrections are required on more than 10% of the re-inspected sample units, then an additional 5% will be re-inspected. This will continue until more than 95% of the re-inspected sections meet the acceptability criteria.

2.2.2 PCI Comparison with Past Inspections

As another level of quality control, the new PCIs are compared with the previous PCIs. If they differ by more than ± 10 PCI points, these sections are automatically flagged for further investigation.

If PCI Increases 10 points:

The section is investigated to see if a maintenance and rehabilitation event has occurred since the last inspection, but which has not been recorded. This can only be resolved with feedback from the City. Typically, it may include activities such as:

- Crack sealing activities – changes medium or high severity cracking to low severity
- Patching activities - alligator cracking that has been removed and patched, so that the resultant PCI is increased.
- Surface seals
- Overlay

Therefore, an up-to-date maintenance and rehabilitation history file in the StreetSaver® database is desirable, both for historical accuracy as well as to provide additional quality control.

If PCI Decreases 10 points:

The section is checked to see if the average deterioration rate (usually 3 to 4 points per year) is exceeded. If the drop in PCI is within the range of what is acceptable, no further action is required. If the drop is more than the acceptable range, a re-inspection will be performed. The default performance curves in the pavement management software form the basis for what is acceptable.

2.3. Inspectors’ Qualifications and Experience

All NCE’s inspectors are required to attend formal training on condition distress inspections. For example, any of the NCE inspectors working on the LTPP project are required to attend a week-long training workshop every year to maintain their certifications.

The Orange County Transportation Agency (OCTA) prequalifies pavement inspectors for work within the County of Orange. This prequalification covers the distresses associated with the ASTM D6433 test method by assessing each inspector’s knowledge of the distresses, severity levels and how to quantify each distress. Each inspector must renew their prequalification every two years.

The Metropolitan Transportation Commission (MTC), requires all inspectors working on pavement management projects funding by MTC to be certified every two years. Each inspector must attend the distress training class provided by MTC. Then they are required to undergo field testing on their knowledge and complete an online test.

Finally, NCE conducts a one-day training and calibration workshop for all NCE staff involved with data collections. This is conducted once a year. The following table lists the inspectors to be assigned to this project, when their last training was and who conducted it.

Inspector Name	Date of StreetSaver Training	Training Conducted by:
Franc Escobedo	November 13, 2017	Lisa Senn
Jacob Rajnowski	November 13, 2017	Lisa Senn
David Bivins	November 13, 2017	Lisa Senn

Resumes of technicians utilized on this project are attached at the end of this document.

3. Safety Procedures

NCE administers a health and safety program in compliance with the Nevada Occupational Safety and Health Act (Section 618.383) and Cal OSHA Title VIII, Section 3203. The program is documented in NCE's *Workplace Safety Program Manual*.

Generally, the safety procedures include:

- Inspectors to wear a Class 2 safety vest at all times;
- Flashing beacon on all vehicles utilized for inspections; and
- Stopped vehicles to be parked at locations away from moving traffic (e.g. nearby parking, shoulders etc.).

On streets where there is a high volume of traffic or high speeds, additional measures may be necessary, such as:

- Inspections to occur during off-peak periods or on weekends;
- Additional inspector to watch out for traffic; and
- Traffic flaggers in extreme cases.

In extreme cases where it is not possible to walk on the pavement surface, inspections will be performed from sidewalks or raised medians. However, this is extremely rare for city or county roads/streets; this is most often encountered on state highways, and lane closures are the most likely option at this point.

All NCE inspectors are required to annually update their online safety programs as administered by "Click Safety". Class Taken are:

- C2 Cal PPE
- C2 Workzone Traffic Control
- C2 Workzone Traffic Safety Tips
- G2 Cal/OSHA Heat Illness

Resumes of Field Inspectors

Franc Escobedo
Engineering Field Technician

Mr. Franc Escobedo has over 15 years of experience as a pavement management technician for NCE. He has performed numerous pavement condition inspections throughout California, Idaho, and Washington. He experience includes distress collection across various Pavement Management Systems including the Metropolitan Transportation Commission StreetSaver, MicroPAVER, Cartegraph, and Hansen systems.

Additionally, Mr. Escobedo has completed both the OCTA MicroPAVER and MTC "Distress Identification" courses for both Asphalt Concrete and Portland Cement Pavements and now assists with the training of agency staff on both courses.

Mr. Escobedo performs all activities relating to pavement data collection using hardcopy forms or tablets. As part of the quality control process, he performs cross-checks of data in the PMS database. He also regularly performs quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, he also generates detailed reports, which are necessary to perform his cross-checks of the collected data.

His field experience and expertise is an added benefit to agencies during field training. Listed below are a collection of agencies for which Mr. Escobedo has performed condition inspections – they total over 6,000 centerline miles of roads and streets.

15

Jacob Rajnowski
Field Technician

Mr. Rajnowski joined NCE in 2016 as a as a pavement management technician and is experienced in collecting distress data for Pavement Management Systems.

Apart from conducting field inspections, Mr. Rajnowski performs all functions related to data collection and is an active participant in the QC process, including cross-checks of data in the PMS database, quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up to date. During this process, detailed reports are generated to perform cross-checks of the data collected. Additionally, Mr. Rajnowski has completed the OCTA MicroPAVER 'Distress Identification' course for Asphalt Concrete and Portland Cement Pavements.

David Bivins
Senior Engineering Technician

Mr. David Bivins has over fifteen years of experience as a pavement management technician. His experience extends beyond data collection for pavement distresses, as a senior technician, Mr. Bivins is one of NCE's most experienced distress collectors and a primary choice for working with/training our clients in field data collection activities.

Mr. Bivins performs all functions relating to data collection using paper forms or a tablet. As part of the quality control process, he performs cross-checks of data in the PMS database. Mr. Bivins has performed quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, Mr. Bivins also generates detailed reports, which are needed to help perform his cross-checks of the collected data.

His field experience and expertise is an added benefit to agencies during field training. Having performed data collection for agencies all over the State of California, there isn't a lot he hasn't seen. Listed below are a collection of agencies for which Mr. Bivins has performed condition surveys, all together they easily account for over 15,000 centerline miles of roads and streets.

Mr. Bivins is proficient in the two most popular distress identification procedures – MicroPAVER and Metropolitan Transportation Commission. He has not only attended yearly in-house training, but has assisted in training local agencies on distress identification and collection procedures.

Education

Civil Engineering Courses
 San Francisco State University, 1994
 AutoCAD Advanced Course
 CAD Masters, Walnut Creek, CA, 1997

Registrations and Certifications

OCTA MicroPAVER Certification 2012
 MTC StreetSaver Certification 2013

Total Years of Experience

15

Representative Projects

Pavement Management Surveys | Senior Field Technician

Albany	Inyo County	San Bruno
Buena Park	Lafayette	San Mateo County
Campbell	Lake County	Santa Barbara
Chula Vista	Los Gatos	County
Citrus Heights	Mammoth Lakes	Santa Cruz
Danville	Marin County	Santa Cruz County
East Bay Regional	Mendocino County	Santa Rosa
Park District	Mission Viejo	Stanislaus County
Elk Grove	Modesto	Stanton
Fremont	Newark	Torrance
Fullerton	Orinda	
Hayward	Pebble Beach	

Projects included various forms of surveys for pavement distress data collection, this may have included walking, windshield, and/or semi-automated.
